

The Homeovitality Health Care System

Super Weight loss, HoV- LEP/ADP. Weight loss, overweight, BMI maintenance.

HoV-LEP/ADP is designed to help you to lose weight more effectively by reducing fat formation and suppressing your appetite, so the urge to over-eat is reduced.

ADP GENE: The anti-obesity gene, ADP, plays a very important role in fat metabolism. Reduced ADP activity results in slower fat metabolism and increased fat deposition. It has now been discovered that most people's ADP gene does not work too well. In the past, when food was scarce, this was a distinct survival advantage because fat could be stored very effectively. Stored fat could then be used to help people to survive much better in times of famine. In modern times though, now that food is much more plentiful, efficient fat storage is a disadvantage, a health hazard. HoV-LEP/ADP is designed to help increase the activity of ADP so that fat is more effectively burned off as energy.

LEP GENE: Increased leptin activity helps people lose weight more effectively by suppressing the appetite, so the urge to over-eat is lessened, making it much more comfortable to eat less. Leptin also helps to increase energy expenditure, so the food that you eat is converted into energy rather than stored in the body as fat.

Scientists have shown that as people lose weight, leptin levels fall. As a result, the urge to over-eat increases and weight is regained. Once weight is lost, increased leptin activity plays an important role in maintaining the desired body mass index. Consequently, continued use of the weight loss product can help avoid weight gain when the desired body mass index is reached.

Recently, Dr. Hedbacker and colleagues at Rockefeller University in the USA have discovered that leptin can correct type 2 diabetes.

Scientists have also shown that leptin plays a very important role in increasing bone density, reducing the likelihood of bone fractures, particularly in post-menopausal women. Bone is continually being remodelled, old bone is being replaced by new bone. Interestingly, Dr. Blain and colleagues at the University of Montpellier, France have shown that leptin promotes new bone formation in a dose dependent manner. So, low leptin activity is associated with reduced new bone development.

It is important to be aware that HoV-LEP/ADP cannot be used as a substitute for a healthy diet or exercise in any weight loss program.

The Homeovitality health care system has been developed to enable the community to take advantage of modern day scientific health care discoveries safely using the principles of Dr. Jenaer and Dr. Marichal's Micro-Immunotherapy alternative health care technology.

Advances in alternative health care.

Using sophisticated molecular biological technology, scientists have now made the remarkable discovery that highly diluted remedies can interact with the genetic blueprint and alter the way a gene is expressed, that is, whether it works or not or how well it can work.

In recent years it has been found that the human genetic blueprint contains genes that promote and maintain health as well as genes that cause many diseases such as cancer. There are thousands of remedies. Some of them target genes that promote health because they can relieve the symptoms of many forms of ill-health. They also must be able to target genes that cause disease because they can readily induce symptoms of disease in healthy subjects and cause aggravations, a kind of unwanted side-effect in some patients. DNA is one of the substances that are used to make remedies.

The use of highly diluted DNA is well established in the practice of alternative health care. It is included in provings and Materia Medica such as those compiled by Dr. A.O. Julian and Dr. R. Murphy.

Homeopathic DNA is derived from various sources such as fish or plants. It includes a wide range of DNA molecules with poorly characterised nucleotide sequences. Therefore, to improve the specificity of gene targeting, many years ago, Drs. Marichal and Jenaer developed the use of highly diluted DNA molecules with very precise nucleotide sequences to prepare remedies that were directed against specific gene targets. Their DNA preparations were designed to target immune response genes and fight infections and control the infectivity of viruses. Their novel gene targeting system, termed Micro-Immunotherapy, proved highly successful.

In recent years, scientists have also discovered much more about genes that protect against disease and promote and maintain natural super-health and even correct some diseases. For example, some genes have been discovered that, when their activity is reduced, result in excessive weight gain, impaired memory, reduced IQ, accelerated ageing and an earlier death. Another gene has been shown to help avoid bone fractures in post-menopausal women. Based on the principles of Drs. Marichal and Jenaer's high dilution technology, the Homeovitality system was developed to promote these newly discovered genetic systems so that practitioners and the public could enjoy many different forms of health improvement, safely.

It now turns out that some of the genes targeted by the Homeovitality system have been shown to have the potential to reduce susceptibility to or even correct many diseases such as diabetes, heart disease, rheumatoid arthritis and cancer. See article by Kay and Rashid published in the Spring Issue (2011) of the Alliance of Registered Homeopaths' journal, Homeopathy in Practice for details.

Interestingly, Professors Kornyshev and Montagnier have demonstrated respectively that DNA molecules, especially when they have been mechanically stimulated have remarkable telepathic properties and they emit electromagnetic signals that are recognised by DNA molecules with the same sequence.

Practitioner information

Other Homeovitality products thus far:

Super Memory/IQ HoV-CM2/S25

Memory loss, IQ, lack of attentiveness

HoV-CM2/S25 targets the CHRM2 and SNAP-25 genes. It has been scientifically formulated to help improve IQ, memory and attentiveness.

The gene SNAP-25 gene is expressed in the brain and is involved in the regulation of neurotransmitter release. Reduced SNAP-25 gene activity results in memory loss.

The CHRM2 gene encodes a cholinergic receptor, muscarinic 2, that belongs to a larger family of G protein-coupled receptors. CHRM2 has been proven to be a key promoter of intelligence.

Super Heart. HoV-KLO

Anti-aging, heart health, kidneys, immunity, blood pressure

HoV-KLO targets the KL gene. KL is one of the most important health promoting genes ever discovered. Scientists have confirmed that KL plays a very important natural role in lowering blood pressure, slowing down the aging process, helping to keep the heart and kidneys healthy and protecting against disease. Unfortunately, as we get older, there is a gradual decline in the amount of KL that our bodies make. Reduced KL activity is associated with impaired immunity and development of rheumatoid arthritis and perhaps other auto-immune processes. Scientists have also shown that KL also suppresses the growth of breast cancer cells, so the benefits of KL become more significant with age.

Super Strong Bones. HoV-CTR

Prevent bone fracture and help maintain bone health

CTR gene plays an important role in bone formation. HoV-CTR is designed to help protect you from fracturing your bones, especially if you are a post-menopausal women.

Scientists have discovered that post-menopausal women are less likely to fracture their bones through a form of natural super-health involving the CTR gene.

Throughout life, bone is continually being remodelled. It is always being broken down by osteoclasts and built back up again by osteoblasts. The CTR gene plays an important role in supporting the activity of osteoblasts so that new bone is built up more effectively.

Allergicare. HoV-INT10

Control allergic reactions

HoV-INT10. Normally, the immune system makes antibodies called IgM, IgA and IgG. Sometimes, people make another type of antibody called IgE. IgE binds to mast cells in the airways, nasal passages and other tissue such as the skin. An allergic reaction is caused by the binding of foreign substances to mast cell bound IgE. HoV-INT10 is designed to support the activity of IL-10 so that the likelihood of IgE antibody formation, and hence development of an allergic reaction is reduced.

Dr. Asadullah and colleagues at the Humboldt University in Germany have demonstrated that susceptibility to development of psoriasis is also associated with reduced IL-10 gene activity. So, targeting the IL-10 gene may also be helpful in controlling psoriasis and other allergic skin conditions.

Safety and standardisation.

Homeovitality products contain DNA molecules with precise sequences that are identical to part of the gene they have been formulated to target. They are entirely specific for their gene targets. They are completely safe because they target only genes that promote health. As indicated, they cannot cause aggravations and cannot cause symptoms of disease in healthy subjects as many homeopathic remedies do. That is also why they are not classified as homeopathic in nature. They are also safe because they do not contain any DNA from foreign or infectious origin nor do they contain any mutated forms of DNA that are associated with many forms of disease.

Although it is modelled on the workings of Dr. Marichal and Dr. Jenaer's Micro-Immunotherapy system, the Homeovitality system is referred to as Micro-DNAtherapy because it uses highly diluted DNA molecules to target parts of the genetic blueprint that are not involved in immunity.

Because each Homeovitality product targets separate independent genetic systems, all products can be taken safely at the same time.

Quality and standardisation are assured because qualitative and quantitative features of the product contents are strictly controlled and reproducible.

The Homeovitality DNA molecules are manufactured and sequenced by GTG Genetic Technologies in Melbourne Australia or by GenScript, Piscataway, USA

How to purchase Homeovitality products.

Homeovitality products may be purchased through the Homeovitality Co. Ltd. UK, by visiting the website www.homeovitalitycentre.com

Manufacturers worldwide may purchase Homeovitality product concentrates so that they can be manufactured on site.

Prices and opportunities available on application.

Homeovitality products are easy to use. Simply, on a clean palate, take 8 drops in a little water and swish round the mouth twice each day. The use of Homeovitality products is based upon the proven health care properties of each of the genes that have been designed to target. Therefore there is no requirement to match symptoms.
